Relay product information

Relay operating modes

Make contact is a relay contact that is open when a relay is in idle position and closes when the relay moves to the operating position.

Break contact is a relay contact that is closed when a relay is in idle position and opens when the relay moves to the operating position.

Change over contact (transfer contact) is a set of contacts with three electrically isolated connections, consisting of a make contact and a break contact. When the switching position changes, the previously closed contact opens first and the previously open contact then closes.

Parameter explanation

Relay applications

This catalog contains the technical specifications that a design engineer needs to select the appropriate relay to meet his requirements. Bosch d.c. relays were originally designed for automotive applications. For all other applications, particularly those with differing requirements, loads or ambient conditions, we recommend prior technical consultation.

Bosch d.c. relays can withstand extreme conditions. They meet the following requirements:

- High-power switching
- Function over a wide temperature range
- Excellent vibration and impact resistance
- Long service life and good climatic resistance

Bosch d.c. relays are used for switching electrical equipment that has a high power or is sensitive to voltage losses. Relays relieve the burden on control switches and provide low voltage drops with economical wire cross-sections. In addition, relays make it easy to set up interlock circuits.

Mini and micro relays are ideal for use where space is at a premium.

Multifunction connectors allow easy assembly and extremely low fault rates on pre-tested wiring harnesses – particularly for OEMs. The same applies to servicing. The following mini and micro relay designs are available:

- Relays without mounting bracket, easy to plug into screw-on combination receptacle housings
- Relays with mounting bracket for connection to five-pole receptacle housing

Power relays allow a rated switching current of more than 50 A. They are suitable for switching motors, starters and other devices.

Terms and definitions

Characteristic quantities and terms

Terms (where standardized, based on DIN 41 215)

Various characteristic quantities and their values allow an appropriate relay to be selected to perform a specific task. Each relay type must meet specific requirements at the specified characteristic values during its service life.

Response voltage Is the minimum excitation voltage that causes a relay to respond, taking into account the ambient temperature and self-heating.

Response time Is the time from closure of the feed circuit until the first closure of a make contact or the first opening of a break contact.

Operating voltage Is the value of the excitation voltage, at which the relay has the characteristic data required for operation.

Excitation voltage Is the electrical voltage that permits the electric current that flows through the excitation winding and causes excitation. Connection is via terminals 1 and 2 and terminals 85 and 86.

Rated value Is the value of a variable (e.g. voltage, current, resistance) for which a relay, its parts and its properties are designed or after which they are named.

Correction factor

Characteristic data on the excitation side relate to an ambient temperature of +20°C. If the ambient temperature is different, the winding resistance and the response and release voltages can be converted using a correction factor K:

$$K = [1 + \alpha(t_a - 20^\circ\text{C})]$$

t_a = Actual ambient or coil temperature

α = 0.004 K⁻¹ (Average temperature coefficient for copper)

Bounce time Is the time from the first to the last closure of a relay contact when the relay is shifting to a different position.

Release voltage Is the value of the maximum excitation voltage that causes a relay to release, taking into account the ambient temperature and self-heating.

Release time (release delay) Is the time from the opening of the feed circuit until the first opening of a make contact or the first closure of a break contact.

Switching voltage Is the voltage that is present between the contacts with an open circuit, when the transient effects have subsided.

Voltage drop Is the voltage at the relay connections for a closed relay contact, measured at a defined current.

Total resistance of the feed circuit Is the electrical resistance between the connecting terminals 1 and 2 and terminals 85 and 86.

Protection and operating modes

Protection types and operating modes

Switching operations

Response is an operation in which a relay moves from its idle position to its operating position.

Opening is an operation that breaks the electrical contact.

Release is an operation in which a relay moves from its operating position to its idle position.

Operating cycle is one response and release of a relay.

Number of operations is the number of operating cycles.

Closing is an operation that results in contact making.

For inductive loads and motors, a protective circuit is often required, which can be implemented with a freewheeling diode parallel to the load (see circuit diagram).

L Inductive load **D** Freewheeling diode
U Supply voltage **R** Relay

Typical load curves

- ① Excitation voltage for relay coil
- ② Current curve with resistance load
- ③ Current curve with lamp load
- ④ Current curve with motor load
- ⑤ Current curve with inductive load
- ⑥ Voltage curve with inductive load

Service life

Mechanical service life specifies the number of operating cycles with current-free relay contacts for which the relay remains operational.

Contact service life specifies the number of operating cycles with electrical contact load for which the relay remains operational.

Switching contacts

Make contact is a relay contact that is open when a relay is in idle position and closes when the relay moves to the operating position.

Break contact is a relay contact that is closed when a relay is in idle position and opens when the relay moves to the operating position.

Double changeover contact (transfer contact) is a set of contacts with three electrically isolated connections, consisting of a make contact and a break contact. When the switching position changes, the previously closed contact opens first and the previously open contact then closes.
